BD137962 1446 bp DNA linear PAT 18-SEP-2002
Nonovalent MHC-binding domain fused proteins and conjugates,
polyvalent MHC-binding domain fused proteins and conjugates,
polymer MHC-binding domain fused proteins and conjugates, and
utilization therefor.

Glaichenhaus N, Malherbe L;

WPI; 2001-182944/18. P-PSDB; AAB67480. New soluble recombinant protein, useful e.g. as immunostimulant, comprises dimeric major histocompatibility complex molecule fused to immunoglobulin Fc region.

Example 1; Page 31-33; 43pp; French.

The specification describes soluble recombinant proteins that comprise at least a dimer formed from the alpha and beta-chains of MHC (major histocompatibility complex) Class I and II molecules in which at least one chain has, attached to its C-terminus, at least part of the Fc region of an immunoglobulin. The recombinant proteins, when linked to an antigenite peptide, are used to count and/or purify antigen-reactive T lymphocytes and to characterize their phenotype, e.g. in preclinical evaluation of vaccines. They are also used as immunostimulants, particularly for vaccine development (against infections and tumours), to count and determine phenotype of autoreactive T cells in subjects with, or at risk of developing, autoimmune diseases, e.g. for staging or evaluating treatments, and (to purify and/or enrich Ag-reactive T cells from cell cultures or patient samples, for use in subsequent curative or preventative cellular therapy. The present sequence encodes a recombinant protein of the invention, comprising an alpha chain of MHC molecules

Multimeric complex for treating autoimmune diseases, comprises first and second single chain MHC class II molecules, each comprising alphal and betal domain linked through amino acid linker and multimerization domain. Disclosure; Page 115; 147pp; English.

The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (MHC) class II molecule and a second recombinant single chain MHC class II molecule, aeach comprising an alphal domain and a betal domain linked through an anito acid linker and a multimerisation domain. The first and the second molecule are linked through the multimerisation domain to form a multimeric complex, The complex, is useful for treating autoimmune diseases. It is useful for treating sullin dependent diabetes, multiple sclerosis, myasthenia gravis, pernicious anaemia, autoimmune encephalomyelitis (BAE), rheumatoid arthritis and systemic lupus erythematosus. The present sequence encodes a single chain MHC class II molecule of the invention

                                                                                                                                                                                                                                                                                                                             448
                                                                                                                                                                                                                                                                                                                                                                                                                                       1582
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          488
```

This nucleotide sequences codes for a bivalent DR2 fusion protein obtained by fusion of the Fc portion of 1gG2a to the 3' end of a DR-alpha -Fos cDNA construct (see AAV16866). The Fc portion was amplified by RT-

PCR from mouse hybridoma L243. The PCR product was then fused in frame with the DR-alpha-Fos construct by overlapping PCR. The DR2-IgG fusion was expressed in the Drosophila Schneider cell system. The invention relates to new soluble monovalent and multivalent Class II MHC fusion proteins comprising a MHC Class II binding domain and a dimerisation domain or an immunoglobulin region that can be used for the treatment of allergic and autoimmune diseases (e.g. multiple sclerosis), for tolerising a subject to foreign tissue before or after organ or tissue transplantation, or for vaccination against pathogens. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                         65

This nucleotide sequence codes for a divalent HLA-DR2 WHC binding domain fusion protein (see AAY31654) comprising an alpha-mating factor secretion signal, the extracellular domain of the HLA-DR2 alpha chain (see Idea in Strate) to DRA+0101), a 7-amino acid linker, the 40-amino acid leucine zipper dimerization domain of Fos, and the FC portion of IgG2a. The DR-alpha-FC chain corresponds to an antibody heavy chain. The invention provides new monovalent, multivalent and multimaric MHC Class II binding domain fusion proteins and conjugates comprising at least a binding domain of an MHC class II alpha or beta chain and a dimerization domain, especially a Fos or Jun leucine zipper domain. The MHC fusion proteins and conjugates can be used: for detecting and isolating T cells having a defined MHC/peptide complex (claimed); to stimulate or activate T cells reactive to a defined MHC/peptide complex (claimed); to stimulate or activate T cells reactive to a defined MHC/peptide complex (claimed); to treat allergic and autoimmune diseases, e.g. multiple sclerosis, rheumatoid architis, pemphigus vulgaris, and systemic lupus erythematosus; and to prevent organ or tissue transplant rejection. The DR2-IGG design was chosen to increase the affector domain, the FC region of IgG2a.

Complement fixation may result in the lysis of target T cells following complex therefore be useful for the selective depletion of autoaggressive T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LyslysThrValTrpArgLeuProGluPheGlyGlnLeuIleLeuPheGluProGlnGly

Novel class II major histocompatibility complex (MHC) fusion protein having MHC class II binding domain of MHC class II alpha chain, and dimerization domain, useful for treating pemphigus vulgaris, rheumatoid arthritis.

Example; SEQ ID NO 11; 55pp; English.

systemic The present invention relates to the class II major histocompatibility complex (MHC) fusion protein having MHC class II binding domain of MHC class II alpha chain and a dimerization domain. The invention is useful in adoptive immunotherapy and tolerizing against foreign tissue. The invention is also useful for treating autoimmune diseases such as pemphigus vulgaris, rheumatoid arthritis, multiple sclerosis and systemilupus erythematosus. The present sequence is the DR2-IgG fusion protein encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                945
                                                                                                                                                                                                                                                              The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (MHC) class Inmolecule and a second recombinant single chain MHC class II molecule, each comprising an alphal domain and a betal domain linked through an amino acid linker and a multimerisation domain. The first and the second multimeric complex, The complex is useful for treating autoimmune diseases. It is useful for treating insulin dependent diabetes, multiple sclerosis, myasthenia gravis, pernicious anemia, autoimmune encephalomyelitis (EAB), rheumatoid arthritis and systemic lupus erythematosus. The present sequence encodes a single chain MHC class II molecule of the invention
                                                                                                                                                                                     Multimeric complex for treating autoimmune diseases, comprises first and second single chain MHC class II molecules, each comprising alphal and betal domain linked through amino acid linker and multimerization domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        78

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (WidC) class II molecule and a second recombinant single chain MHC class II molecule, each comprising an alphai domain and a betal domain linked through an amino acid linker and a multimerisation domain. The first and the second molecule are linked through the multimerisation domain. The first and the second multimeric complex, The complex is useful for treating autoimmune diseases. It is useful for treating insulin dependent diabetes, multiple solerozis, myssthenia gravis, pernicious anaemia, autoimmune encephalomyelitis (EAB), rheumatoid arthritis and systemic lupus erythematogus. The present sequence encodes a single chain MHC class II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Multimeric complex for treating autoimmune diseases, comprises first and second single chain MHC class II molecules, each comprising alphal and betal domain linked through amino acid linker and multimerization domain.

The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (MHC) class II molecule and a second recombinant single chain MHC class II molecule, each comprising an alphal domain and a betal domain linked through an amino acid linker and a multimerisation domain. The first and the second molecule are linked through the multimeriation domain to form a multimeric complex, The complex is useful for treating autoimmune diseases. It is useful for treating insulin dependent diabetes, multiple sclerosis, myasthenia gravis, pernicious anaemia, autoimmune erocphalomyelities (EARS), rheumatoid arthritis and systemic lupus erythematosus. The present sequence encodes a single chain MHC class II molecule of the invention
                                             Multimeric complex for treating autoimmune diseases, comprises first and second single chain MHC class II molecules, each comprising alphal and betal domain linked through amino acid linker and multimerization domain.

159 ValTyrGluThrSerPheLeuValAsnArgAspHisSerPheHisLysLeuSerTyrLeu 178
                                                                                                                                                                                            Multimeric complex for treating autoimmune diseases, comprises first and second single chain MHC class II molecules, each comprising alphal and betal domain linked through amino acid linker and multimerization domain.
                                                                                                                                                                                                                                                                            The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (MHC) class II molecule and a second recombinant single chain MHC class II molecule, each comprising an alphal domain and a betal domain linked through an amino acid linker and multimerisation domain. The first and the second molecule are linked through the multimerisation domain. The first and the second multimeric complex, The complex is useful for treating autoimmune diseases. It is useful for treating insulin dependent diabetes, multiple sclerosis, myasthenia gravis, pernicious anaemia, autoimmune erocephalomyelitis (EAB), rheumatoid arthritis and systemic lupus erythematosus. The present sequence encodes a single chain MHC class II molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ValTyrGlnSerProGlyAspileGlyGlnTyrThrHisGluPheAspGlyAspGluLeu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ımmunogenic compositions comprising Flt-3 ligand encoding polynucleotide
and one or more antigen, or cytokine encoding polynucleotides, useful for
suppressing tumor growth and for treating autoimmune diseases (e.g.
rheumatoid arthritis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of patient-specific bicistronic chimeric idiotype VR1642 (plasmid VAXID), which is used to treat B-cell lymphoma patients. The plasmid includes the cytomegalovirus immediate-early promoter, enhancer and 5' untranslated sequences, driving the expression of mouse-human chimeric immunoglobulin light and heavy chain sequences. The human light and heavy chain variable regions are derived from B-cell lymphoma cell line RAMOS. The transcriptional terminator region includes polyA and termination signals from the bovine growth hormone gene. According to the invention, co-administration of VR1642 with a plasmid (see AAR30314) encoding human Fms-like tyrosine kinase (Flt-3 ligand) provides a means of treating a patient with B-cell lymphoma. The present sequence is that of the cloning cassette of a tri-cistronic mAb17-1A expression and dihydrofolate reductase selection construct for use in the production of recombinant 1962a mAb17-1A antibody. In examples from the invention, comparison of the original, hybridoma-derived immunisation antigen 17-1A and recombinantly expressed mAb17-1A from CHO cimmunisation antigen not immunological differences in rhesus monkey critals. Both formulations showed identical kinetics building up the immunisation antigen and target antigen specific immune response, and raised 190 and 190 titres were similar. Recombinant mAb17-1A is an comparison of primates and comprising at least a part of a murine conformant antibody of the invention designed for immunisation of primates and comprising at least a part of a murine 1922 subtype amino acid sequence with mammalian glycosylation.

Recombinant DNA methods are used to produce the immunogenic antibody in a standardised manner. The humoral immune response induced by the 1962a immunogenic antibodies of the invention is significantly improved in the specificity against selected targets and epitopes. The improved

```

immune response is dependent on the glycosylation pattern of the antibody. Recombinant antibody expressed in hamster or human cells were shown to have a similar immunogenicity as antibody expressed by murine hybridoma cells. This is of particular relevance for antibodies that are to be used for immunisation purposes. The antibody may have a murine amino acid sequence or any other mammalian amino acid sequence that is combined with the murine igg2a part. Preferably mammalian sequences are human, humanized, human/murine chimeric or murine sequences. The antibody may also be an anti-idiotypic antibody or a mimotopic Abl antibody. The IgG2a immunogenic recombinant antibody or a mimotopic Abl antibody. The IgG2a immunogenic antibody. The vaccines may be used for the prophylaxis and therapy of cancer associated diseases, e.g. metastatic disease in cancer patients. The vaccine specifically modulates antigen-presenting calls in vivo or ex vivo, thus generating an immune response to the epitope that is targeted by the IgG2a immunogenic antibody. The preferred method of producing the antibody-expression construct containing at least a nucleotide sequence encoding a kappa light chain and a nucleotide sequence encoding a gamma heavy chain, where at least one of these sequence comprises a nucleotide sequence encoding at least a part of a mutine appressing the sequences under the control of a single CMV promoter to produce an intact antibody. The kappa light chain and gamma heavy contentrations of 5.100 und/ml are expressed in a shoule equance. concentrations of 5-300 ug/ml are achieved

neurotoxin monoclonal antibody M(alpha)2-3 now monocloxin monoclonal antibody M(alpha)2-3 now monoclonal antibody M(alpha)2-3 now monoclonal antibody M(alpha)2-3 now monoclonal antibody M(alpha)2-3 now AAQ48040 no aderived cDNA using primers AAQ48041 and AAQ48042. The two amplified from the same vector, the H-chain fragment was inserted into the same vector; the H-chain fragment was inserted into the first formal and antibodian and the L-chain fragment was inserted into a cassette which contained and the L-chain fragment was inserted into a cassette which contained sequence, a signal peptide and the first formal and the transcription termination sequence of phoA. The termination codon and the transcription termination sequence of phoA. The fusion construct is expected to to encode a hybrid protein comprising two identical Ab-derived units. The invention also covers hybrid proteins containing two different Ab-derived units (i.e. to produce bispecific antibodies). When a toxic protein is used in place of phoA, the hybrid molecules can be used as cell-targetting therapeutic agents. (Updated on 15-MAR-2003 to correct New immunoglobulin hybrid proteins - with immunoglobulin fragments linked to dimeric protein, for diagnostic or therapeutic use. A fragment of the heavy chain (VH + CH1) from the anti-snake small Example 1, Fig 3A; 37pp; French

Sequence 1581 BP; 435 A; 448 C; 373 G; 325 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      472
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AED19725
```

The invention describes an agent (1) for treating prion disease or delivering a substance to the lesioned region of prion disease, comprishing a mesenchymal cell. Also described are: a nucleic acid (II) having an anti-prion antibody gene comprising: an antibody heavy chain gene having SEQ ID No: 1, 3, 5, 30, 32 and 34, a nucleotide sequence consisting of a degenerate genetic code, which encodes a polypeptide same

Claim 4; SEQ ID NO 5; 34pp; Japanese.

cc as that of the above nucleotide sequence, a nucleotide sequence, which is a mutant of the above sequences or a nucleotide sequence that is complementary to the above sequences and that hybridizes under stringent conditions with the above sequences and that hybridizes under stringent conditions with the above sequences; and an antibody light chain gene having SEQ ID No: 2, 4, 6, 31, 33 and 35, a nucleotide sequence conditions with the above nucleotide sequence a nucleotide sequence that is a mutant of the above sequences, or a nucleotide sequence, which is a mutant of the above sequences, or a nucleotide sequence that is conditions with the above sequences and that hybridizes under stringent conditions with the above sequences and that hybridizes under stringent conditions with the above sequences and that hybridizes under stringent conditions with the above sequences and that hybridizes under stringent conditions of interprion chimeric antibody (IV) comprising variable region of antibody encoded by (II) and constant region of antibody of animal other than constant prion proliferation inhibition activity, comprising transducing a gene that provides abnormal prion proliferation inhibition activity to constant antibody being obtainable by (MI) or by utilizing (II) or (III); a cutilized for treating prion disease; use of a mesenchymal cell for cutilized for treating prion disease; use of a mesenchymal cell for preparing or prion disease, comprising utilizing mesenchymal cell. (I) is useful for treating prion disease or delivering a substance to the lesioned region of prion disease, comprising utilizing mesenchymal cell. (I) is useful for having abnormal prion proliferation inhibition activity. (I) or (VI) is useful for treating prion disease. (II) or (III) or (III) or having abnormal prion proliferation disease. This sequence an anti-Promise of menoclonal antibody heavy chain. Note: This sequence and anti-Promise of prion disease. The symptome of prion disease. The symptome of sequence of the prince of prion or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       165
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              185

The invention describes a method of modulating production of an amyloidogenic peptide comprising contacting a cell which is expressing contacting a cell which is expressing contacting accell which is expressing contacting to the precursor from which the amyloidogenic peptide is derived and a Nogo polypeptide, with a Nogo antagonist. Also described are: use of a Nogo antagonist in the manufacture of a medicament for the treatment or prophylaxis of a disease involving amyloidosis; and a method of treatment or prophylaxis of Alzheimer's disease comprising administering to the human in need an anti-Nogo antibody. The invention is used for modulating contaction of amyloidogenic peptide in, e.g. Alzheimer's disease, stroke, traumatic brain injury and spinal cord injury, fronto-temporal dementias, peripheral neuropathy, Parkinson's disease, Huntington's disease, creutzfeldt-Jakob disease, amyotropic lateral sclerosis, multiple sclerosis, or inclusion body myositis. The invention provides an unexpected route for therapeutic intervention in particularly Alzheimer's disease, this sequence represents an anti-Nogo-antibody 2AlO heavy chain Modulating production of amyloidogenic peptide in, e.g. Alzheimer's disease, by contacting cell and Nogo polypeptide with Nogo antagonist Sequence 1407 BP; 378 A; 396 C; 346 G; 287 T; 0 U; 0 Other; Example 4; SEQ ID NO 49; 53pp; English 20-DEC-2004; 2004WO-GB005343 22-DEC-2003; 2003GB-00029684. 22-DEC-2003; 2003GB-00029711. Example 3; SEQ ID NO 49; 143pp; English.

injury, Alzheimer's disease.

The invention describes an antibody (A1) or its functional fragment, that chinds with and neutralizes human neurite outgrowth (NOGO). Also described are: providing a first vector encoding a heavy chain of the antibody; corrected antibody and providing a second vector encoding a light chain of the antibody; corresponding the host cell in culture media (preferably serum free) under conditions permissive to the secretion of the antibody from the host cell into the culture media; recovering (and optionally purifying) the into the culture media; recovering axonal sprouting involving contacting a human axon with an anti-NOGO antibody. The antibody is useful in the preparation of a medicament for treating or prophylaxis of stroke and correct injury, Alzheimer's disease, frontotemporal dementias (tauopathies), cord injury, Alzheimer's disease, frontotemporal dementias (tauopathies), cord injury, Parkinson's disease (Huntington's disease and multiple sclerosis); Creutzfeldt-jakob disease (CDD), Schizophrenia, amyotrophic lateral sclerosis (ALS), inclusion body myositis. The contingual diseases/disorder tine a human patient suffering, or at risk of developing, stroke or other contaction polynucleotide used in the creation of recombinant anti-NOGO arribodies. antibodies.
